

CASE STUDY : iamHere

Rapyder Performed Security Audit For iamHere And Implemented The Recommendations To Improve Their Security Posture

Client

iamHere

AWS Services

Amazon Security Hub,
Guard Duty, AWS Shield
& AWS Config

Introduction

iamHere is a location-first social network providing a hyperlocal community platform for social collaboration and commerce.

iamHere is a special category winner of the Government of India's Aatmanirbhar App Challenge, ELEVATE grant program, Economic Time's Emerging Tech Startup award, rated among the Top Social Apps by Appbrain and recognized by Financial Express and AsiaOne.

Business Needs

While already leveraging the power of the Amazon Web Services (AWS) cloud in their development environment, iamHere Software Labs needed a partner who could help them mitigate risk and security issues in the production environment.

They were seeking a consultancy that could conduct a thorough AWS security audit for their infrastructure and "look over their shoulders" as they transitioned.

By utilizing AWS tools and services such as Amazon Security Hub, Guard Duty, AWS Shield & AWS Config, the environment is now better organized and stored more meaningfully for iamHere Software customers.

Solution Approach

- Rapyder understanding of the AWS Production ecosystem and the security features helped accelerate the project
- Rapyder's certified Lead Solutions Architects and Cloud Engineers conducted interviews with lamHere IT and developers to understand the environment & identify security gaps
- Rapyder also performed a security and best practices review of the AWS environment, going over each component

Reaping Rewards

- lamHere was successful in mitigating risks and conduct a security audit for their production environment
